Hey Guys,

Here is the deal. If you are exceedingly proficient at Angular 2, [ASP.NET](#) core or Xamarin please tell me. I've already been talking to vdoc and I've kind of got a handle on a jumping off point for building this project. It looks like back end will be edited in Visual Studio and front end will be configured in VS code. Once the repository is created I'll push the project to it and we can move forward. I have installed Visual Studio 2017 but i'm a little shakey on it. Mine keeps getting hung up and it's pretty aggravating. My last 2 groups used discord for communications for the duration of the project. It's the only time I've ever used it so if everyone votes for that i'm cool with it. I'm also cool with email or a text conversation. My number is [225-287-6344](tel:225-287-6344) please text me if you have questions.

Drew

I am definitely willing and able to work to work in any of the three required technologies. I think I might have a preference toward Angular 2 since I feel pretty comfortable with it and don't have to switch my development environment (I'm usually on Linux) to work with it. Otherwise, I have no problem doing what needs to be done and can work on all or parts of the .NET or Xamarin areas as well.

I already have VS Code set up, and will probably install Visual Studio 2017 tonight. I still have 2015 and Xamarin installed from the previous phases.

My number is [985-285-7237](tel:985-285-7237) and texts are best for me with that, but I definitely prefer Slack or Discord for communications beyond initial stuff. Emails get too messy.

I have one big request: can we set up or decide on a Git workflow? Doing so would really help us avoid too many conflicts and help us be more efficient when working on the project.

Thanks,

Billy

I'm really glad you have a preference towards angular 2 because that's my biggest weakness. Setting up a workflow sounds like a smart idea since there are a lot of moving parts in this phase. I'll set up a discord server when I get home.

I would definitely say I'm stronger on back end stuff. I did enjoy working in angular 2 as well. I feel comfortable working in [asp.net](#) and making back end. If I were to do backend I would probably end up doing more as well (connections, classes, etc).

I'll be installing VS2017 tomorrow when I'm on campus with faster Internet.
